

UICollectionViewDropProposal

Your proposed solution for handling a drop in a collection view.

Declaration

```
class UICollectionViewDropProposal : UIDropProposal
```

Overview

Create instances of this class in the `collectionView(_:dropSessionDidUpdate:withDestinationIndexPath:)` method of your drop delegate object. You create drop proposals to let the collection view know how you intend to handle a drop at the currently specified location. The collection view uses that information to provide appropriate visual feedback to the user.

Topics

Creating a Drop Proposal

```
init(operation: UIDropOperation, intent: UICollectionViewDropProposal.Intent)
```

Creates a drop proposal object that specifies how to incorporate the dropped content.

Getting the Proposed Drop Location

```
var intent: UICollectionViewDropProposal.Intent
```

The option to use when incorporating the dropped items into your content.

```
enum UICollectionViewDropProposal.Intent
```

Constants indicating how you intend to handle a drop.

```
enum UIDropOperation
```

Operation types that determine how a drag and drop activity resolves when the user drops a drag item.
